## Content Design strategy

The whole idea was to start off with the index page of the website, separate this page into 4 different sections that represent each GeoCity I was going to use. So a section for Athens, Hollywood, TimeSquare and Fashion Avenue. These sections would link into each respective webpage, where flexboxes would control the layouts of each page, the style.css file would have all the styling required for each webpage. From here on information was gathered to full in the html tag layout of each webpage to make a unique experience for each webpage, also following the topic relating to the geocity so for example the Athens webpage would contain information about philosophy. After all the information input, bug fixing and testing was used to fix everything and make sure everything is working. The content is designed to be easily accessible and workable on any device and also easy to read and navigate without being confused or getting lost on the webpage, the webpages also all link back to the index page if you have either gotten lost or desire to visit any of the other webpages. The webpages are easily linked from the index.html file so finding what you would like to see is not difficult at all. The webpages provide ease of access to any relevant information and is extremely easy to navigate. The file directory is also properly set out to not cause any confusion. Overall what was set out to be done from the start has been accomplished.
